

3.4. Software Resource Report

Our development team is currently managing a mid-size software project, and we have identified several resource challenges. First, we have too many active branches in the repository, which makes it difficult to manage the deployment process. The testing server is also consuming too much memory, so the system is forced to optimize itself every few hours to avoid crashing.

Compared to last sprint, we have fewer bugs to fix today, which means the team can focus themselves on writing cleaner code. However, the application still requires less bandwidth than expected, since the new module compressed itself automatically before sending data to the server.

QUANTIFIERS

3.2 Cant us noncount classification

How many?

deployments
bugs
code

How much?

bandwidth
memory
documentation

3.3 ACTIVITY 1

- The app is using too much data. We need to optimize it.
- We have fewer tasks today than yesterday, so we can finish early
- Never say "too many bugs". Always use too many bugs because you can't count them
- this updated version of the software requires less power to run.

ACTIVITY 2 - Reflexive Pronouns

1. The app restarts itself after an error
2. She designed the UI herself
3. We deployed the server ourselves
